

**FOR IMMEDIATE RELEASE:**

### **High-Volume Gun Barrel Drilling**

MARSHALL, Mo. – January 1, 2020 – The DeHoff G548-D4 is a four spindle gundrilling machine designed for high-volume production of gun barrels. It features automated loading and unloading of the barrels to enable long periods of untended machine running. Up to 48 barrels can be pre-loaded into the magazine holder, and lift-and-carry automation is used to load the barrels in and out of the fixturing.

The G548-D4 has four gundrilling spindles with a barrel diameter range from 17 to 50 caliber, and a maximum barrel length of 27 inches (686 mm). The machine incorporates steel box ways and hand-scraped mating components (instead of linear guide ways and milled surfaces). This results in superior vibration damping and extended gundrill tool life.

The G548-D4 is part of a turnkey package of gun barrel manufacturing equipment offered by DeHoff, including machines for gundrilling, pull-reaming, button rifling, cut rifling, as well as tooling, stress relieve ovens, and air gauging equipment. DeHoff machines are Made-in-the-USA by Kays Engineering in their Marshall, Missouri facility.
