PAWS Workholding Eight Station 3J Collet Clamping System

PAWS Workholding, based out of Clio, MI, has developed an innovative hydraulic driven 3J Collet Clamping System. Ideal for OEM's and Production Machining operations, the PAWS 3J Collet Clamping System provides automated concentric clamping of eight parts up to 44.45mm in diameter on the O.D.

The PAWS 3J System delivers industry leading repeatability and increased rigidity when machining round parts by using a proprietary "Pull-to-Close" system. Additionally, the system provides dead length stop capabilities to allow accurate control of part Z height dimensions during machining. The system is comprised of an eight station 3J Collet Clamping Fixture Plate, a hydraulic manifold underneath to automate the clamping, and an air over oil, dual acting, hydraulic pump.

PAWS Workholding

PAWS Workholding has been providing clamping and fixturing solutions to the manufacturing community since the early 1990's. The company's staff of dedicated, knowledgeable engineers and designers develop first class solution to help customers achieve manufacturing output goals. As the originator of the patented hydraulic clamping system, the PAWS team understands the importance of efficiency and productivity in a production milling environment.
