

Reactor Technologies Begin Operations Implementing Technology Into Chassis Systems

For Immediate Release - Phoenix, AZ - Reactor Technologies begins operations in the development and integration of sophisticated technology into rifle stocks and chassis systems.

Reactor has been founded by industry veteran Ryan McMillan, as a platform to develop and integrate modern technology, into the stock and chassis sector of the industry. Reactor begins operations with a leadership team of over 25 years of combined experience in gun industry and is set to disrupt the long standing status quo.

Reactor will come to the market with the Fusion Module that integrates technology with compatible chassis systems, in mid January 2020. Media and industry leaders will be able to see the first production model at Booth #N335 in the NEXT section at Shot Show 2020.

“With advanced technology integrated into every aspect of our lives, we are accustomed to monitoring, sharing, and accessing unlimited data with the touch of a button. One area we haven’t seen great advances in technology integration, as been the firearms industry. Reactor is about to change that.” Said Ryan McMillan - CEO of Reactor Technologies *“We are developing and integrating technology that will revolutionize the way you gather and analyze your shooting data, which will get you on target faster and more consistently than ever before.”*

Reactor Technologies is currently seeking collaboration opportunities with stock companies, gun manufacturers, and software developers to integrate this technology throughout the shooting industry. The adaptive nature of the Reactor Fusion Module lends itself to easy integration into existing platforms and will create substantial value for future and existing customers.
